

# EDCO Magna Trap Tool Series

## REMOVE

Remove Epoxies, Waterproof & Industrial Coatings

PCD Tooling is another form of industrial diamond, which is recessed into the tooling head to claw or scrape the material off the concrete floor. A diamond segment bar is placed on the back of the tool plate to keep the tooling cutting level.

This tool “claws” at the surface material and scratches it off the concrete floor. Because of the very aggressive action of the removal, this tool leaves deep scratches on the floor after the coating is removed.

If a thick coating is being re-applied, these scratches are ok and will be covered by the thick coating and provide an excellent concrete surface bonding

**Pro Tip** If a thinner coating (sealer or guard) is being reapplied, and it will not cover the scratches on the floor, the floor may be needed additional diamond grinding to take those deep scratches out.

This is an opportunity to rent out an additional set of diamond tooling as well to remove the scratches or exfoliate the concrete.
